

SecureComm

Cloud-based Service

SecureComm is HKC's cloud based solution for both installers and end users. It was developed to counteract problems caused by GSM blockers. The solution includes a "heartbeat" using GPRS/IP to notify in the event of a loss of communication.*

Connection to the SecureComm server can be achieved using a variety of communication modules – GSM/GPRS, Wifi Card or LAN Card. Using the SecureComm server and SmartLink700, installers will be able to perform Up/Download over IP/GPRS and in addition will be able to carry out remote maintenance and adjustments to detection devices and control equipment.

The HKC App will allow end users full control of their security system including issuing commands and receiving notifications and alarm messages (text & audio) from the system.

*Communication is dependent on the GPRS network provider or the router installed.
